

01 – Brainstorming & Ideation

Auto-Ticket Classification Using Flow Designer

Project Idea

The project focuses on automatically classifying ServiceNow Incident tickets using Flow Designer. When a ticket is created or updated, the flow evaluates ticket information such as the short description and description, identifies a matching classification, and updates the Incident with the configured category or routing information.

Problem Identification

Manual ticket classification can require support staff to inspect each new ticket and decide which category or queue it belongs to. Repetitive classification can delay routing and may produce inconsistent categorization.

Proposed Solution

Project Objectives

Implement an Incident classification flow using ServiceNow Flow Designer.

Automatically classify tickets according to configured rules.

Reduce repetitive manual classification work.

Improve consistency in Incident categorization and routing.

Demonstrate trigger, decision, action and update steps in Flow Designer.

Validate the classification behaviour using test cases.

Key Components

Basic Project Flow

Incident Created/Updated → Flow Trigger → Read Ticket Details → Classification Decision → Update Incident → Classified Ticket

Expected Outcome

The expected outcome is an Incident workflow in which new tickets are automatically classified according to the configured Flow Designer rules, reducing unnecessary manual classification.

Team Members

Stage	Activity
1	User creates or updates an Incident
2	Flow Designer trigger starts the flow
3	Flow reads relevant Incident information
4	Decision logic checks classification rules
5	Matching classification is selected
6	Incident fields are updated automatically
7	Ticket is available with structured classification

Component	Purpose
ServiceNow Incident	Source record containing the ticket information.
Flow Designer	Automation engine that executes the classification workflow.
Trigger	Starts the flow when the configured Incident event occurs.
Decision / If logic	Checks the ticket content against classification rules.
Update Record	Writes the selected classification to the Incident.
Testing Evidence	Screenshots and test results proving the flow behaviour.
