

# 03 – Project Design

## Auto-Ticket Classification Using Flow Designer

### System Design

The system design describes how a ServiceNow Incident is processed by Flow Designer. A trigger starts the flow, ticket information is evaluated, decision logic selects a classification, and an update action writes the result.

### Workflow Design

User creates Incident → Trigger detects the configured event → Flow reads ticket fields → Decision checks rules → Matching branch is selected → Incident is updated → Classification is visible on the Incident.

### Flow Design

#### Classification Logic

### UI Design

The UI design represents the Incident form before and after the flow executes. The main visible change is the classification field or configured routing field populated by automation.

### Designed User Flow

### Design Outcome

The design provides a clear Flow Designer architecture for automatic Incident classification while keeping the decision rules visible and maintainable.

### Team Members

| Layer            | Component              | Purpose                                                   |
|------------------|------------------------|-----------------------------------------------------------|
| User Layer       | ServiceNow User        | Creates or updates an Incident.                           |
| Record Layer     | Incident Form          | Stores ticket information used by the flow.               |
| Automation Layer | Flow Designer          | Controls the automated classification process.            |
| Logic Layer      | Decision / If branches | Matches ticket information to configured classifications. |
| Action Layer     | Update Record          | Writes the classification to the Incident.                |
| Output Layer     | Classified Incident    | Displays the resulting classification.                    |

| Step | Flow Designer Element | Purpose                                                           |
|------|-----------------------|-------------------------------------------------------------------|
| 1    | Trigger               | Start when an Incident is created or the configured event occurs. |
| 2    | Get/Use Record Data   | Use short description, description and other required fields.     |
| 3    | Decision              | Evaluate classification conditions.                               |
| 4    | Classification Branch | Select Hardware, Software, Network, Access, Email or Other.       |
| 5    | Update Record         | Write the selected classification to the Incident.                |
| 6    | End                   | Leave the classified Incident ready for normal processing.        |

| Branch   | Condition concept                               | Output                |
|----------|-------------------------------------------------|-----------------------|
| Hardware | Ticket contains hardware/device indicators      | Hardware              |
| Software | Ticket contains software/application indicators | Software              |
| Network  | Ticket contains connectivity/network indicators | Network               |
| Access   | Ticket contains login/account/access indicators | Access                |
| Email    | Ticket contains email/mailbox indicators        | Email                 |
| Other    | No configured rule matches                      | Other / Manual Review |

| Step | User/System Action         | Result                                                 |
|------|----------------------------|--------------------------------------------------------|
| 1    | User creates an Incident   | Initial Incident is displayed.                         |
| 2    | User enters ticket details | Information becomes available to the flow.             |
| 3    | Trigger starts the flow    | Automation begins processing.                          |
| 4    | Decision evaluates rules   | A classification branch is selected.                   |
| 5    | Update action runs         | Incident classification is updated.                    |
| 6    | User opens/views Incident  | Classified ticket is available for further processing. |
