Auto-Ticket Classification Using Flow Designer

Project Title

Auto-Ticket Classification Using Flow Designer

Introduction

Auto-Ticket Classification Using Flow Designer is a ServiceNow Administrator project focused on automating the classification of Incident tickets. The project uses Flow Designer to evaluate configured ticket information, select an appropriate classification, and update the Incident record.

Project Background

Incident records can arrive with different types of support requests. When classification is performed manually, support teams may spend time reviewing repetitive information. A condition-based Flow Designer workflow can perform a consistent first-level classification before normal Incident processing continues.

Problem Statement

The project addresses the need to reduce repetitive manual classification of Incident tickets and provide a consistent classification result based on configured rules.

Project Purpose

Automatically classify Incident tickets using Flow Designer.

Reduce repetitive manual classification actions.

Improve consistency of ticket categorization.

Provide a maintainable rule-based automation workflow.

Demonstrate practical ServiceNow Administrator configuration.

Project Objectives

Technologies and Platform

System Working Principle

Implementation Procedure

Project Benefits

Project Deliverables

Project Outcome

The intended outcome is a ServiceNow Incident process in which Flow Designer automatically classifies tickets according to the configured rules and updates the relevant Incident field. The completed implementation should be supported by configuration screenshots, testing evidence, documentation and a project demonstration.

Conclusion

The Auto-Ticket Classification Using Flow Designer project demonstrates how ServiceNow automation can be used to perform consistent first-level Incident classification. By combining a trigger, decision logic and update actions, the project provides a structured workflow that can reduce repetitive manual classification and support more organized Incident processing.

Team Members

No.	Objective	Description
1	Configure Flow Designer	Create the automation flow for Incident classification.
2	Implement classification logic	Configure decision branches for supported ticket categories.
3	Update Incident records	Write the selected classification into the Incident.
4	Provide fallback handling	Handle tickets that do not match a configured rule.

No.	Objective	Description
5	Validate implementation	Test the flow using representative Incident inputs.
6	Document the project	Maintain configuration, screenshots, testing and demonstration evidence.

Technology / Component	Role in the Project
ServiceNow	Primary platform.
Incident Management	Main application area and record type.
Flow Designer	Automation platform used to execute classification logic.
Decision / If Logic	Evaluates conditions and selects the classification branch.
Update Record Action	Writes the selected classification to the Incident.

Stage	Process	Outcome
1	User creates or updates Incident	Ticket information is stored.
2	Flow trigger activates	Classification workflow begins.
3	Decision evaluates input	Matching classification is selected.
4	Update action runs	Incident classification is updated.
5	User continues Incident process	Structured ticket is available for further handling.

Step	Activity	Evidence
01	Open ServiceNow Flow Designer.	Flow Designer screenshot
02	Open/create the classification flow.	Flow overview
03	Configure Incident trigger.	Trigger screenshot
04	Configure classification decision logic.	Decision screenshot
05	Configure update actions.	Action screenshot
06	Create a test Incident.	Incident screenshot
07	Execute the flow.	Execution screenshot
08	Verify classification.	Result screenshot
09	Run test cases.	Testing evidence
10	Prepare final documentation and demonstration.	Final project files

Benefit	Description
Automatic Classification	Reduces repetitive first-level ticket classification.
Consistency	Configured rules provide repeatable results for matching inputs.
Reduced Manual Work	Support users do not need to classify every matching ticket manually.
Structured Processing	Tickets can be routed into a predictable classification process.
Maintainability	Flow Designer makes the automation logic visible and configurable.
Better Documentation	Configuration, testing and demonstration evidence can be maintained phase-wise.

Phase	Deliverable
01	Brainstorming and Ideation document
02	Requirement Analysis document
03	Project Design document, workflow and UI design
04	Project Planning document
05	Project Development documentation and Flow Designer evidence

Phase	Deliverable
06	Test cases, execution results and testing screenshots
07	Complete Project Documentation
08	Demo script and demonstration video link
